## Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims in the application:

## Listing of claims:

- 1. (Currently amended) A contactless push-button device comprising:
  - a push-button element that is linearly displaceable between a first position and a second position and biased to move from the second position to the first position;
  - a magnet mounted to the push button element;
  - a Hall Effect transducer mounted in line with the linear displacement direction of the push-button so that when the push-button moves from the first position to the second position the distance between the magnet and the Hall Effect transducer changes; and
  - a programmable microprocessor for being assigned a unique address, the programmable microprocessor electrically connected to the Hall Effect Transducer; transducer and programmed to execute a field averaging algorithm to compensate for changes in quiescent Hall Effect voltages.
- 2. (Original) The contactless push-button device of claim 1, further comprising a plate mounted between the push-button element and the Hall Effect Transducer.
- 3. (Original) The contactless push-button device of claim 1, further comprising a feedback device that is electrically connected to the microprocessor.
- 4. (Original) The contactless push-button device of claim 1, further comprising a system controller that is interfaced with the microprocessor, the controller assigning an address to the push-button device during a start-up procedure.
- 5. (Original) The contactless push-button device of claim 1, wherein the microprocessor is programmed to contain a unique address.

Serial No. TBA, filed TBA Docket No. 1116109-0009-CON

Page 5 of 6

- 6. (Original) The contactless push-button device of claim 3 further comprising: a serial bus connected to the microprocessor; and an elevator controller connected to the serial bus.
- 7. (Original) The contactless push-button switch of claim 6, wherein the serial bus is an RS 485 bus.
- 8-12. (Canceled)
- 13. (Currently amended) The device of claim 12, further comprising A contactless, rotary switch device comprising:

a rotating disk having a surface;

one or more magnets disposed on the disk;

one or more Hall Effect transducers located on a planar surface that is parallel to
the surface of the disk, the distance between the Hall Effect transducers and
the magnets varying as the disk rotates; and

a programmable microprocessor that is electrically connected to the microprocessor and programmed to execute a field averaging algorithm to compensate for changes in quiescent Hall Effect voltages.

- 14. (Original) The device of claim 13, further comprising a system controller that is interfaced with the microprocessor, the controller for assigning an address to the rotary switch device during a start-up procedure.
- 15. (Original) The device of claim 13, wherein the microprocessor is programmed to contain a unique address.
- 16. (Original)The device of claim 13 further comprising: a serial bus connected to the microprocessor; and an elevator controller connected to the serial bus.

17-20. (Canceled)
